

# Homework 4 Written

Points: 35

The pdf you submit must look exactly like this with the answers and all supporting works shown on the the page with the question.

|                   |                    |                    |
|-------------------|--------------------|--------------------|
| Last Name         | First Name         | Student ID         |
|                   |                    |                    |
| Partner Last Name | Partner First Name | Partner Student ID |
|                   |                    |                    |

1. (3) Given that you have a Fully Associative cache of size  $2^{10}$  bytes with a line size of 16 bytes show how an Address of 29 bits would be partitioned.

2. (3) Given that you have Direct Mapped cache of size  $2^{12}$  bytes with a line size of 32 bytes show how an Address of 50 bits would be partitioned.

3. (3) Given that you have a 5 way Set Associate cache of size 5242880 bytes with a line size of 64 bytes show how an Address of 64 bits would be partitioned.

4. (3 per) Here is a string of hex address references given as byte addresses: 1, 2, 3, 1A, A, 1B, 16, 14, 3, 12, 9, 23, 3A, 5, 19, 1, 9
1. Assuming a **direct mapped cache** with a **total size of 16 bytes** and a **line size that is 1 byte**. that is initially empty, label each reference in the list as a hit or miss and show the final contents of the cache tag bits for each line. If a line is not written to leave its tag bits blank. Compute the hit rate for this example.

2. Repeat 4.1 but for a **direct mapped cache** that is **16 bytes big** and has a **line size of 4 bytes**

3. Repeat 4.1 but for a **two way set associative cache** that is **16 bytes big** and has a **line size of 1 byte**. Assume an **LRU replacement strategy** is used.

4. Repeat 4.1 but for a **fully associative** cache that is **16 bytes big** and has a **line size of 1 byte**. Assume an **LRU replacement strategy** is used.

5. Repeat 4.1 but for a **fully associative** cache that is **16 bytes big** and has a **line size of 4 bytes**. Assume an **LRU replacement strategy** is used.
